

CELANESE WATER POLICY

Celanese recognizes that water is a vital raw material for our business and a shared natural resource. Water is essential for life and access to safe water and sanitation is a basic human right. Celanese strives to demonstrate its role as a responsible steward for water by practicing sustainable management of water resources where we source raw materials and where our facilities are located.

It is the policy of Celanese to:

1. Comply with all water related regulations and integrate industry best practices into operations.
2. Reduce water consumption in our operations through continual improvements in our water consumption efficiency.
3. Return 100% of wastewater from our operations to the environment safely.
4. Conduct local water risk evaluations especially in regions of water stress.
5. Disclose our water data for setting and monitoring progress against our corporate water consumption intensity target in a transparent manner.
6. Provide appropriate access to safe and potable water, sanitation, and hygiene for employees at worksites under Celanese's control.
7. Engage in public water advocacy at local and national levels.

Celanese strives to implement these seven policy objectives at the corporate and manufacturing facility levels within the company. The corporate level focuses on managing the global water data collection system, setting targets, tracking, and publicly disclosing our global water performance. The manufacturing facility level focuses on providing reliable water supplies, accurately measuring, and reporting water usage and using water efficiently by implementing best industry practice including reuse and recycling of water.

Suppliers and joint venture companies are encouraged to follow this policy. Celanese will review this sustainable water policy from time to time as appropriate and at least once every five years.

Effective: 2/4/22
